

DroolShield® Protects Machines and Insulation

Customers with machines that “drool” or “blow back” plastic assume they won’t be able to use insulation jackets because of the potential machine damage.

DroolShield® protects machines, bands and wire.

DroolShield® is a PTFE-coated, air craft aluminum disc (clean-room suitable) that fits on the nozzle or nozzle body to block

drool or blow-back from reaching insulation jackets, heater bands, and wires. Plastic drool collects on the shield instead of damaging or destroying your investments. DroolShield® withstands temperatures up to 700°F (370°C), making them a reusable, long-term solution for blow back at an affordable price.

UniVest® equipment insulation jacket construction.
